

Barcode project briefing

What we do today on paper, what the phone app changes, and how we'll get there in small, comfortable steps.

A friendly overview for volunteers · attached to the project news email

In short: every plant in our nursery moves through a handful of familiar steps — arriving, getting an accession number and labels, being repotted, being sold, or being culled. For years we've written those steps on paper and later typed them into Access. The barcode app is our way to make that lighter, faster, and more accurate — without rushing anyone.

1. The plant's life in our nursery

Almost everything we do with a plant fits into six processes. Think of them as the plant's journey from “brand new idea” to “sold, kept as stock, or finished”.

Plant lifecycle at Growing Friends

Steps 3–4 often repeat while a plant is growing. Steps 5–6 end that batch's story.

Figure 1. Six nursery processes around one plant batch (accession).

1. Brand-new plant (never grown here before). Starts an approval path that includes a Royal Botanic Gardens botanist. Once approved, it moves to step 2 for an accession number.

2. **Propagating an existing plant** (seed, cuttings, or divisions). We get an accession number for the current batch and enter plant details into Access from a paper notebook.
3. **Requesting and printing labels.** The request goes on paper; a database operator types it into Access. Labels are printed with Access data plus a separate print program (NiceLabel).
4. **Repotting** — tubes to pots, pots to larger pots, pots to hanging baskets, or one large pot into many tubes. Counts are not always reported fully or correctly. We currently use the *same paper form* for label requests and for pot-type / quantity changes, which sometimes causes mix-ups.
5. **Selling a plant to a customer.** Sales analysis is slow because everything starts on paper. Database operators often don't have time to enter every sale into Access.
6. **Culls (death and discard).** Written on paper — when someone remembers. The list helps spot-check and find "lost" plants, but again there often isn't time to enter every cull into Access.

2. Why paper makes life harder

We all know these pain points already — this just names them clearly:

- **Double work** — write it down, then type it again.
- **A bottleneck** — almost everything waits on database-manager time, especially before big sales.
- **Easy mistakes** — mixed-up numbers and names; some people write total pots, others only the new ones.
- **More chasing** — the database manager has to ask "what did you mean?", which makes the bottleneck even tighter.
- **Label delays and duplicates** — we wait, forget we already ordered, and order again.
- **Incomplete data** — Access becomes something we can't fully trust for day-to-day decisions or analysis.

Paper as we use it today
— the potting book

3. What we're building instead

An app on a phone that lets us leave paper behind — not overnight, but as our big goal. The everyday idea is deliberately simple:

The app also shows the plants currently in the nursery and the container counts stored in the database (tubes, pots, misc./hanging baskets, stock plants). That means we can gently check and correct as we go — so before a big sale, the picture is already fresher. That's the ideal we're aiming for; we'll grow into it.

No panic. This is a big change, so we move in small steps, keep paper in parallel while we learn, and enjoy the process. Otherwise — why did we start?

4. A quick tour of the app

The home screen is deliberately big and simple (designed for tired eyes and busy hands). Main actions today:

Typical flows

- **Sell:** Scan → enter line (qty, price, discount) → cart → confirm receipt
- **Cull:** Scan → enter quantity & notes → success
- **Print label:** Scan → choose how many copies → request queued
- **Repot:** Scan → update tube / pot / misc. / stock counts → save
- **Also:** History (receipts, culls, labels, repots) and a searchable Plants list

Real screens from the app — big buttons, high contrast, tap (not gesture).

Plants list

The **Plants** tab shows what's currently in the nursery. For each accession you can see the name and group, plus how many containers of each type are recorded — tubes (**T**), pots (**P**), misc./hanging baskets (**M**), and stock plants (**St**). That makes it easy to check counts against what's on the bench and keep the list up to date.

5. Our roadmap — three phases

PHASE 1 · WE ARE HERE

Sales & culls in the app

Use the app for selling and culling, **while still duplicating on paper** until everyone is comfortable. This path is already tested and working. From now on: if you have something to cull, let's do it in the app together.

PHASE 2 · NEXT

Repot + label requests

Use the app for repotting (changing container types and counts) and for label-print requests. Roll out group by group. Also work out how to scale beyond a single shared Android phone.

PHASE 3 · LATER

Accessions from parent plants

When we're happy with the earlier flows and ready to stop duplicating them on paper, use the app to obtain accession numbers for batches from existing parent / stock plants.

NOT IN SCOPE YET

Brand-new plants + approval

Getting accession numbers and entering details for a plant never grown here before still goes through botanist approval and manual entry by the database manager. We'll revisit after Phase 3 is solid.

Which processes the app will touch, and when

Figure 3. Roadmap against the six processes — we start where the paper pain is highest.

6. How the data moves (the simple version)

Full technical architecture will live in a separate document for anyone who wants to dive deep. For all of us, this picture is enough:

The app can't talk to Access directly — Sheets is the friendly middle layer.

Figure 4. Access ⇌ Google Sheets ⇌ phone. “Sync now” in Access refreshes the plant list toward the app.

If you've noticed a new **Sync now** button in Access — that's what pushes an up-to-date plant list out toward the app. Sheets also lets us build reports; those will come in a separate email with links.

7. Two important practical notes

The nursery is many years old. Access holds roughly **25,000** barcodes, but most belong to finished batches. Loading all of them would slow everything down. Active barcodes are under **2,000**. We treat a barcode as active when *any* container count is greater than zero (tubes, pots, misc., or stock plants).

If a scan isn't found

That usually means Access shows zero containers for that accession. For **sales and culls**, that's OK — the app still lets you record it and keeps the accession number so we can reconcile later. (Label print and repot are stricter and may ask you to contact the database administrator.)

Tip for Access operators

When you add a new accession, please set at least **1 tube**. In real life, nobody requests a new accession with zero containers — and that “1” keeps the barcode active in the app's plant list.

Reports. Details and links will arrive in a separate email — this briefing stays focused on processes and the path ahead.

What you can do this week. If you have a plant to discard, find Natasha. We'll scan it in the app together — simple, quick, and a nice way to try the new flow. Alison, Anne, and Judith have already tried it and loved it. Hope we all will do.
